1960, v. 3, no. 3, p. 69-73.

The unrestricted passage of free flowing materials through orifices is investigated. It is established that the flow-rate is determined by the ability of a "dynamic arch" to be formed over the orifice and does not depend either on the height of the column of the free flowing material over the orifice (if it exceeds the diameter of the orifice), or on the character and velocity of the movement of the particles outside the limits of the dynamic arch zone which extends over the orifice by a height approximating to the width of the diameter.
